

Assignment 1: Sequential Storyboard

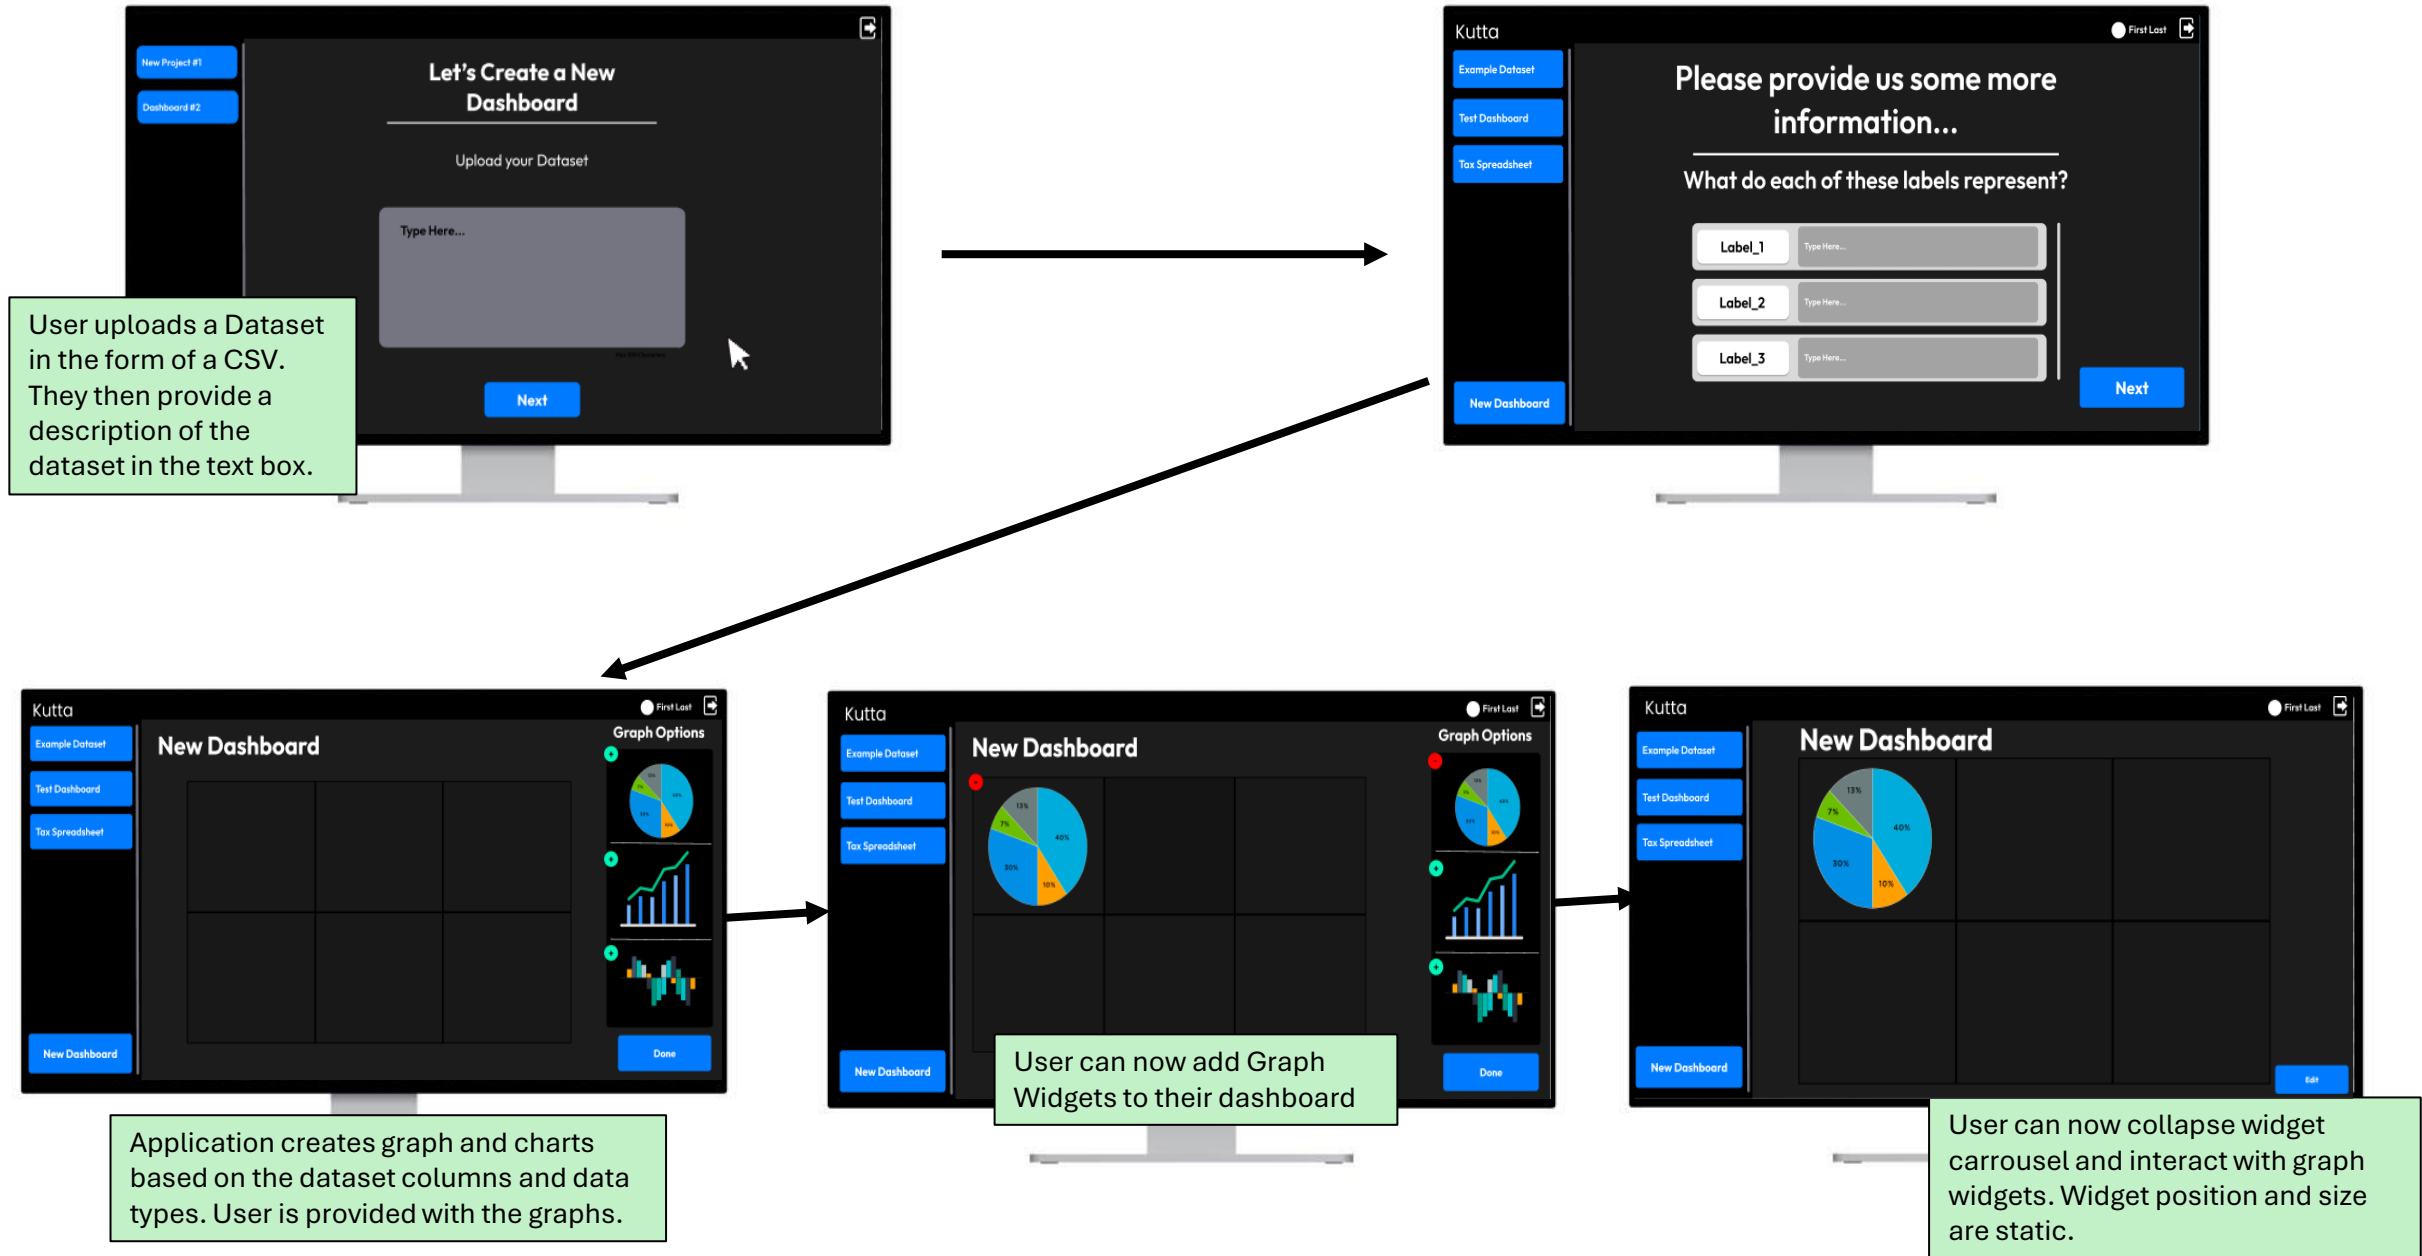

For my interaction design, I would like to revisit my web-based data visualization platform. This ongoing project heavily incorporates an interactive GUI, allowing users to create graphs, widgets, and charts from datasets in CSV and Excel formats.

Currently, users upload a dataset and provide a description for context. The program then extracts the columns and prompts users to add labels and descriptions for each one. Finally, after clicking "Create," the system generates graph widgets and places them in a carousel.

Current Dashboard-Creation Flow

User must provide information on the extracted columns

2

Current Dashboard In Flow:

- Attach a CSV or Excel File
- Describe the dataset and give prompt context
- Give each column a description
- Give each column a data type
- Wait for Graphs and Charts to render
- Add Graphs and Charts to Dashboard

- Tedious
- Many Steps involved
- More User input needed than necessary

- Solution – Remove the user input page
- Allow the AI model to extract the column descriptions and column datatypes automatically (**See Figma**)

Current Widget Interactions:

- Can only pin widget to a set, static grid box
- Can not move around widget or resize the widget dynamically
- Widgets cannot be altered, except a zoom in option

- Tedious
- User interaction is minimal and does not allow for more engaging visualization experience

- Solution – Add interactive widgets, so resizing, dynamic placeholder, and flexible movement (**See Figma**)
